</table>

\(^1\)Data from randomized controlled trial  
\(^2\)Data from longitudinal study  
\(^3\)Data from cross-sectional study  

Legend:
All percentages reference a common reference level of 62.5 nmol/L as shown on the chart. %’s reflect the disease prevention % at the beginning and ending of available data. Example: Gestational diabetes incidence is reduced by 11% when the serum level is 76.6 nmol/L vs the reference level of 62.5 nmol/L. There is a 33% reduction in incidence when the serum level is 104.6 nmol/L vs the reference level of 62.5 nmol/L.
